Full Website Audit Report

Key Findings & Priorities

Client: Valvanta

Website: valvantadigital.co.za

Prepared by: Valvanta Digital Agency

Methodology

This audit uses Lighthouse in navigation mode with mobile emulation.

Lighthouse version	13.0.1
Audit date	2026-03-07T09:06:49.947078+00:00
Categories tested	p, e, r, f, o, r, m, a, n, c, e, ,, , s, e, o
Mode	navigation
Device emulation	mobile, desktop
URLs tested	5

Execution config

Config key	Value
only_categories	performance, seo
mobile	mobile emulation + throttling
desktop	desktop preset

Standards Alignment Statement

This report aligns findings to WCAG 2.1 Level A and AA (automated checks only), Google Core Web Vitals, and Google Search Essentials.

This audit reflects automated testing only and does not constitute full legal compliance certification.

Limitations & Scope Disclaimer

This report is based on automated Lighthouse checks and reflects a point-in-time snapshot. It does not replace manual testing, user research, or full compliance reviews.

Findings should be validated in real user conditions and with assistive technologies where applicable.

Tested URLs

All URLs included in this audit run.

#	URL
1	https://valvantadigital.co.za/
2	https://valvantadigital.co.za/about
3	https://valvantadigital.co.za/services/website-design
4	https://valvantadigital.co.za/services/ecommerce
5	https://valvantadigital.co.za/services/social-media-management

Key Findings & Priorities

Prioritisation method: Prioritised by (1) user-perceived impact on mobile responsiveness and load (TBT, main-thread work, transfer size), (2) frequency across URLs (repeated large assets/bundles and consistent non-200 responses), and (3) implementation effort (quick wins first: image optimization and deferral/cleanup before deeper architectural changes). SEO items are deprioritised because there are zero failures in the provided data.

Issue	Priority	Impact	Effort	Short explanation
High mobile Total Blocking Time (site average ~403.5 ms) with a worst-case page at ~887.5 ms	High	Improves mobile responsiveness and reduces input delay risk, especially on mid/low-end devices where main-thread contention is amplified.	Medium	Multiple pages show substantial main-thread work and script evaluation; mobile TBT is materially higher than desktop (desktop average ~3.7 ms), indicating the primary UX risk is mobile interactivity rather than initial paint timing.
Overweight images on key pages (e.g., homepage ~3.13 MB image transfer out of ~3.77 MB total)	High	Reduces download time, decode time, and memory pressure; typically improves Speed Index and overall load robustness on mobile networks.	Low	Largest transferred resources are images (e.g., ~810 KB and ~646 KB PNGs; ~553 KB JPEG). Image transfer size dominates total transfer on several URLs.
Large and repeated JavaScript bundle transfer (~309 KB) with large resource size (~1,030,665 bytes) on multiple pages	Medium	Reduces parse/eval costs and main-thread work, helping bring mobile TBT down and improving consistency across pages.	Medium	The same script asset appears as a top transfer item on multiple URLs and coincides with notable script evaluation time in main-thread breakdowns.
High third-party transfer on /about (~1.25 MB) and slower third-party server response times (notably Instagram origins)	Medium	Improves performance consistency and reduces dependence on variable third-party latency, particularly on mobile.	Medium	The /about page shows third-party transfer of ~1,248,892 bytes on mobile and ~1,245,653 bytes on desktop; server latency types show Instagram response times ~433-469 ms on that URL.
Recurring non-200 network requests (~2 per URL across the dataset)	Low	Reduces wasted requests and potential retry/backoff delays; improves reliability and cleanliness of page loads.	Low	Every tested URL shows code_non_200_requests_count = 2, indicating consistent background errors/redirects that should be identified and corrected.
SEO audits show 0 failures across all URLs (average_score = 1.0 on mobile and desktop)	Low	No immediate SEO remediation required based on the provided Lighthouse SEO data.	Low	All reported SEO checks pass across 5 URLs; remaining items are not applicable rather than failing.
