Full Website Audit Report

Technical & Performance Report

Client: Valvanta

Website: valvantadigital.co.za

Prepared by: Valvanta Digital Agency

Methodology

This audit uses Lighthouse in navigation mode with mobile emulation.

Lighthouse version	13.0.1
Audit date	2026-03-07T09:06:49.947078+00:00
Categories tested	p, e, r, f, o, r, m, a, n, c, e, ,, , s, e, o
Mode	navigation
Device emulation	mobile, desktop
URLs tested	5

Execution config

Config key	Value
only_categories	performance, seo
mobile	mobile emulation + throttling
desktop	desktop preset

Standards Alignment Statement

This report aligns findings to WCAG 2.1 Level A and AA (automated checks only), Google Core Web Vitals, and Google Search Essentials.

This audit reflects automated testing only and does not constitute full legal compliance certification.

Limitations & Scope Disclaimer

This report is based on automated Lighthouse checks and reflects a point-in-time snapshot. It does not replace manual testing, user research, or full compliance reviews.

Findings should be validated in real user conditions and with assistive technologies where applicable.

Tested URLs

All URLs included in this audit run.

#	URL

5	https://valvantadigital.co.za/services/social-media-management

Executive Summary

What the data shows
What the data shows
- Mobile paint metrics are consistently strong across the site: average FCP ~1206 ms and average LCP ~1236 ms.
- Mobile interactivity is the main constraint: average Total Blocking Time (TBT) ~403.5 ms (with one URL far higher), indicating JavaScript and main-thread work are delaying responsiveness.
- Page weight is moderate-to-high and skewed toward images and scripts: average total transfer ~2.19 MB; images ~1.39 MB; scripts ~0.73 MB; third-party ~0.48 MB.
- Server latency is not the primary bottleneck but is non-trivial: average ~331 ms on mobile and ~402 ms on desktop, with some third-party origins (notably Instagram) slower than the first-party origin.
- Desktop results are generally excellent for interactivity: average TBT ~3.7 ms, and lower main-thread work (~533 ms), suggesting mobile CPU constraints amplify the cost of current JavaScript and rendering work.

Key strengths
Key strengths
- Fast first paint and largest paint on both devices (site averages: mobile FCP/LCP ~1.2 s; desktop FCP ~0.56 s, LCP ~0.98 s).
- Low desktop blocking time (TBT ~3.7 ms average), indicating good baseline runtime performance on stronger devices.
- Reasonable request counts on average (32.4 requests), with a high proportion of successful responses (30.4 200s on average; ~2 non-200s).
- CSS and document transfer sizes are relatively small compared to images/scripts (avg CSS ~44 KB; avg document ~23 KB), reducing render-blocking pressure from these resource types.

Primary weaknesses
Primary weaknesses
- Elevated mobile TBT (~403.5 ms average) suggests too much main-thread work before the page becomes reliably responsive; the worst page reaches ~887.5 ms TBT.
- Main-thread work composition indicates time spent in "Other" and rendering/layout/script evaluation (mobile average main-thread work ~2396 ms; with large contributions from Other ~1200 ms and paint/composite/render ~732 ms).
- Heavy images dominate transfer on key pages (e.g., homepage ~3.13 MB images of ~3.77 MB total), increasing download/decoding work and memory pressure on mobile.
- Large and recurring JavaScript payloads on service/about pages (e.g., a ~309 KB transfer JS bundle with ~1,030,665 bytes resource size) combined with high third-party transfer on /about (~1.25 MB) increase parse/eval and network overhead.
- Non-200 responses occur consistently (2 per URL), which can create wasted work and latency even when UX metrics look good.

High level roadmap
High level roadmap
- Phase 1 (high impact, lowest risk): Reduce mobile main-thread blocking
- Break up and defer non-critical JavaScript on pages with high TBT (prioritise /services/social-media-management and the homepage).
- Audit long tasks (high task counts on some pages, e.g., homepage ~5878) and reduce work in "Other" and rendering/layout buckets by removing non-essential runtime work and simplifying above-the-fold UI.
- Phase 2 (high impact): Reduce image transfer and decoding costs
- Target the largest images by transfer size (e.g., ~810 KB and ~646 KB testimonial PNGs on the homepage; ~553 KB JPEGs used across pages). Resize/compress to the displayed dimensions and prefer more efficient formats where feasible.
- Ensure below-the-fold images are not competing with critical resources (prioritise hero/above-the-fold images, deprioritise the rest).
- Phase 3 (medium impact): Control third-party overhead and latency variance

- Reduce or delay third-party resources where transfer size is high (notably /about with ~1.25 MB third-party transfer) and where server response times are slower (Instagram origins).
- Phase 4 (ongoing): Hygiene and stability
- Investigate and eliminate recurring non-200 requests (average ~2 per page) to reduce retries/failures and ensure consistent loading behavior.

Summary metric	Mobile	Desktop
Overall score	0.91	0.97
Critical findings	0	0
High findings	0	0
Moderate findings	1	0
Advisory findings	0	0
Risk summary	Moderate risk: improvements recommended to reduce exposure.	Low risk: only advisory items identified.

Performance (Mobile) Findings

Findings are aligned to recognized standards and classified by severity.

Title	Severity	Standard	Description	Recommendation	Affected
Overall performance score is below target	Moderate	Core Web Vitals Performance Score	Lighthouse performance score is 0.79.	Prioritize performance wins that improve Core Web Vitals and reduce blocking time.	https://valvantadigital.co.za/services/social-media-management

Performance (Desktop) Findings

Findings are aligned to recognized standards and classified by severity.

No findings matched the inclusion rules for this report.

Site Averages - Detailed Breakdown (Mobile)

Good targets: FCP <= 1.8s, LCP <= 2.5s, Speed Index <= 3.4s, TBT <= 200ms, Server latency <= 200ms.

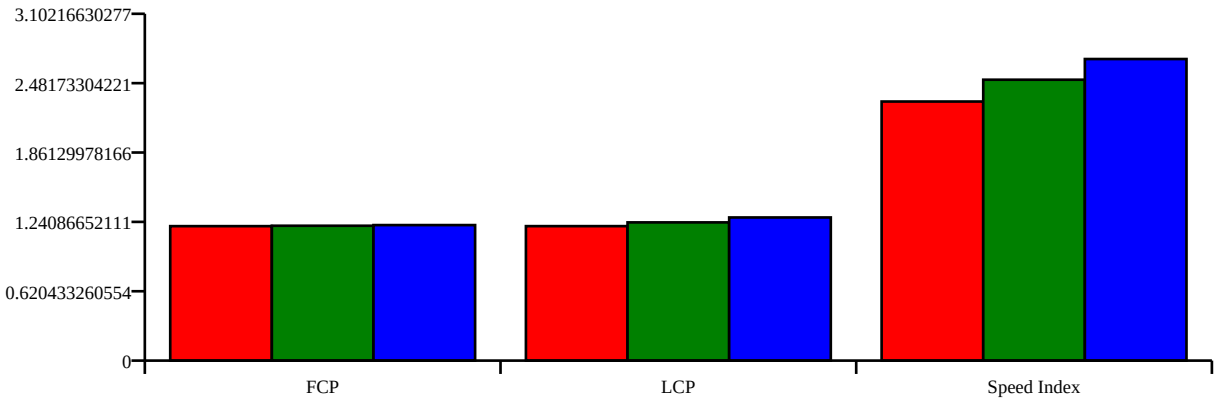

Benchmarks: **Top 10% (p10)** is the best-performing 10% of tested pages for each metric.

Metric definitions

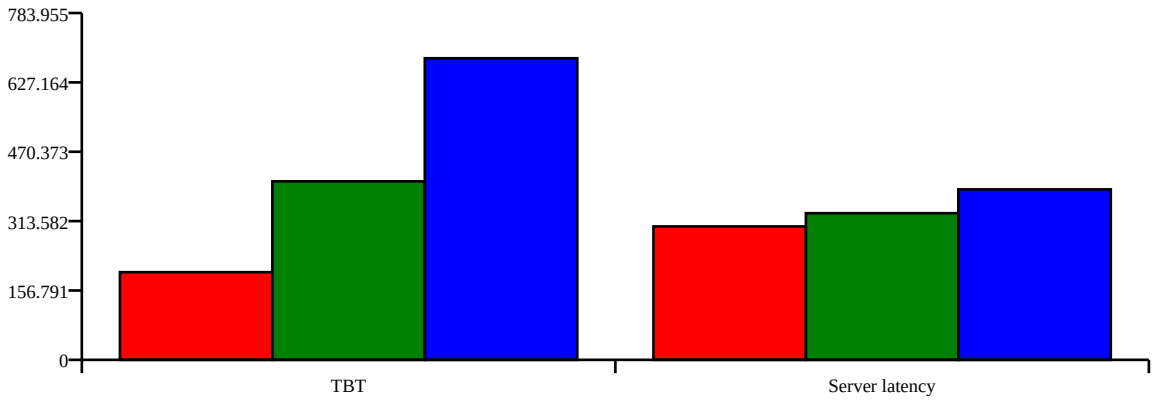

Metric	Meaning	Good target
FCP	First time content appears on screen.	≤ 1.8 s
LCP	Largest content element render time.	≤ 1.5 s
Speed Index	How quickly the page looks complete.	≤ 3.4 s
TBT	Total main-thread blocking time.	≤ 200 ms
Server latency	Backend responsiveness during load.	≤ 200 ms

Breakdown charts

Timing metrics (seconds)

Blocking and latency (milliseconds)

Basic metrics

Metric	Top 10% (p10)	Average	Worst 10% (p90)

FCP	1.20 s	1.21 s	1.21 s

Per URL Breakdown (Mobile)

Each URL is reported using the same breakdown sections as Site Averages.

Targets: FCP <= 1.8s, LCP <= 1.5s, Speed Index <= 3.4s, TBT <= 200ms, Server latency <= 200ms.

https://valvantadigital.co.za/

What the data shows
What the data shows
- Mobile: FCP 1215.76 ms, LCP 1215.76 ms, Speed Index 2357.58, TBT 360.5 ms.
- Desktop: FCP 594.175 ms, LCP 594.175 ms, Speed Index 1467.58, TBT 5.0 ms.
- Transfer size is high and image-heavy: total ~3,765,933 bytes (mobile) / ~3,767,159 bytes (desktop); images ~3,128,903 bytes (mobile) / ~3,129,051 bytes (desktop).
- Main-thread work is extremely high on mobile (4692.95 ms), dominated by Other (2399.93 ms) and Style & Layout (778.98 ms) plus Rendering (732.16 ms).

Key strengths
Key strengths
- Strong paint timings despite large payloads (mobile LCP ~1.22 s; desktop LCP ~0.59 s).
- Desktop interactivity is excellent (TBT 5.0 ms) with moderate main-thread work (839.70 ms).
- Request volume is moderate (28 total; 26 returning 200).

Primary weaknesses
Primary weaknesses
- High mobile main-thread work (4692.95 ms) and elevated mobile TBT (360.5 ms) indicate responsiveness risk on mobile devices.
- Very large image transfer (~3.13 MB) dominates the page; top transfers include ~810 KB and ~646 KB PNGs and a ~553 KB JPEG.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce mobile blocking and main-thread work:
- Identify and remove/defers non-critical work contributing to large "Other" (2399.93 ms) and heavy Style & Layout/Rendering time (778.98 ms / 732.16 ms).
- Shrink the largest images by transfer size:
- Optimise the large testimonial PNGs (~810 KB and ~646 KB) and the ~553 KB project JPEG by resizing to display dimensions and compressing to reduce transfer and decoding cost.
- Clean up network errors:
- Investigate the two non-200 requests and eliminate redirects/404s to reduce wasted work.

Basic metrics	Value
FCP	1.22 s
LCP	1.22 s
Speed Index	2.36 s
TBT	360 ms

Main thread work breakdown	Value
Total (numericValue)	4693 ms
other	2400 ms
styleLayout	779 ms
paintCompositeRender	732 ms

Diagnostic metrics	Value
Requests	28
Tasks	5878
Total byte weight	3.6 MB

Network metrics	Value
200 responses	26
Non-200 responses	2

Resource summary	Transfer size
Total	3.6 MB
Images	3.0 MB
Scripts	583.9 KB
Stylesheets	15.1 KB
Documents	13.7 KB
Third-party	286.1 KB

Network server latency	Value
Server latency	314 ms

https://valvantadigital.co.za/about

What the data shows
What the data shows
- Mobile: FCP 1203.09 ms, LCP 1278.09 ms, Speed Index 2734.39, TBT 199.0 ms.
- Desktop: FCP 576.81 ms, LCP 576.81 ms, Speed Index 1319.46, TBT 10.0 ms.
- Very high request count: 82 requests (80 returning 200; 2 non-200).
- Third-party transfer is very large: ~1,248,892 bytes (mobile) / ~1,245,653 bytes (desktop) out of ~2.12 MB total transfer.
- A large script is a top transfer item: index-Dn6mhLJz.js transfer ~309,375 bytes with resource size ~1,030,665 bytes.

Key strengths
Key strengths
- Good interactivity for mobile relative to other URLs (TBT 199.0 ms) and strong desktop responsiveness (TBT 10.0 ms).
- Paint timings are stable and fast (mobile FCP ~1.20 s, desktop FCP ~0.58 s).

Primary weaknesses
Primary weaknesses
- High request count (82) increases overhead and opportunities for latency variance.
- Heavy third-party transfer (~1.25 MB) is a major contributor to total bytes and can create performance variability.
- Mobile main-thread work includes substantial Script Evaluation (452.17 ms), aligning with the large JS payload observed in transfers.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce third-party byte cost and dependency:
- Defer or reduce third-party resources contributing to the ~1.25 MB third-party transfer on this page.
- Reduce JS cost driving script evaluation:
- Review the large JS bundle (index-Dn6mhLJz.js) and reduce delivered code where possible to cut parse/eval overhead on mobile.
- Reduce request overhead:
- Consolidate or eliminate non-essential requests to bring 82 requests down, prioritising the heaviest/least critical resources first.
- Resolve non-200 requests:
- Identify and fix the two non-200 responses to remove wasted network and processing.

Basic metrics	Value
FCP	1.20 s
LCP	1.28 s
Speed Index	2.73 s
TBT	199 ms

Main thread work breakdown	Value
Total (numericValue)	1372 ms
other	512 ms
scriptEvaluation	452 ms
styleLayout	282 ms

Diagnostic metrics	Value

Requests	82
Tasks	1766
Total byte weight	2.0 MB

Network metrics	Value
200 responses	80
Non-200 responses	2

Resource summary	Transfer size
Total	2.0 MB
Images	620.0 KB
Scripts	1.2 MB
Stylesheets	155.2 KB
Documents	69.4 KB
Third-party	1.2 MB

Network server latency	Value
Server latency	433 ms

https://valvantadigital.co.za/services/website-design

What the data shows
What the data shows
- Mobile: FCP 1203.35 ms, LCP 1203.35 ms, Speed Index 2290.64, TBT 197.5 ms.
- Desktop: FCP 541.23 ms, LCP 717.23 ms, Speed Index 1085.71, TBT 0.0 ms.
- Low request count: 18 requests (16 returning 200; 2 non-200).
- Total transfer is moderate: ~1,531,487 bytes (mobile) / ~1,532,044 bytes (desktop); images are the largest share (~898 KB).
- The JS bundle (index-Dn6mhLJz.js) is again a top transfer resource (~309 KB transfer; ~1,030,665 bytes resource size).

Key strengths
Key strengths
- Strong desktop responsiveness (TBT 0.0 ms) and good desktop paint timings (FCP ~0.54 s).
- Efficient request count (18) relative to other pages, supporting predictable loading behavior.
- Mobile TBT (197.5 ms) is comparatively controlled.

Primary weaknesses
Primary weaknesses
- Mobile still shows meaningful main-thread script evaluation time (493.31 ms), consistent with the large JS bundle being a top transfer item.
- Images are a significant portion of transfer (~898 KB), leaving optimisation headroom.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce JavaScript evaluation pressure on mobile:
- Trim or defer non-critical code in the recurring JS bundle to reduce Script Evaluation (493.31 ms) and lower TBT further.
- Optimise image payload:
- Reduce image transfer (~898 KB) by compressing/resizing key images, prioritising those above the fold.
- Fix non-200 responses:
- Locate the two non-200 requests and correct them (remove broken URLs/redirect chains) to improve load cleanliness.

Basic metrics	Value
FCP	1.20 s
LCP	1.20 s
Speed Index	2.29 s
TBT	198 ms

Main thread work breakdown	Value
Total (numericValue)	1486 ms
other	615 ms
scriptEvaluation	493 ms
styleLayout	269 ms

Diagnostic metrics	Value

Total	1.5 MB
Images	877.2 KB
Scripts	584.1 KB
Stylesheets	15.1 KB
Documents	9.8 KB
Third-party	286.1 KB

Network server latency	Value
Server latency	303 ms

https://valvantadigital.co.za/services/ecommerce

What the data shows
What the data shows
- Mobile: FCP 1206.84 ms, LCP 1281.84 ms, Speed Index 2642.26, TBT 373.0 ms.
- Desktop: FCP 551.53 ms, LCP 1641.53 ms, Speed Index 1114.49, TBT 3.0 ms.
- Requests are low: 17 total (15 returning 200; 2 non-200).
- Total transfer is moderate: ~1,548,297 bytes (mobile) / ~1,549,261 bytes (desktop); images ~916 KB and scripts ~598 KB.
- Main-thread on mobile is notable (1877.79 ms) with material Script Evaluation (480.61 ms).

Key strengths
Key strengths
- Low request count (17) supports manageable network overhead.
- Desktop interactivity is strong (TBT 3.0 ms).

Primary weaknesses
Primary weaknesses
- Mobile TBT is elevated (373.0 ms), indicating responsiveness risk compared with other service pages.
- Desktop LCP is relatively high (1641.53 ms) compared with the rest of the site, suggesting the largest element on desktop takes longer to complete.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce mobile blocking time:
- Focus on reducing Script Evaluation (480.61 ms) and overall mobile main-thread work (1877.79 ms) to bring TBT down from 373.0 ms.
- Reduce weight of top resources:
- Optimise the main JS bundle (~309 KB transfer) and key images (including the service image ~289 KB transfer) to reduce load and processing cost.
- Resolve non-200 responses:
- Investigate and fix the two non-200 requests to eliminate wasted network and potential retries.

Basic metrics	Value
FCP	1.21 s
LCP	1.28 s
Speed Index	2.64 s
TBT	373 ms

Main thread work breakdown	Value
Total (numericValue)	1878 ms
other	1038 ms
scriptEvaluation	481 ms
styleLayout	248 ms

Diagnostic metrics	Value

Images	894.4 KB
Scripts	583.8 KB
Stylesheets	15.1 KB
Documents	9.4 KB
Third-party	286.2 KB

Network server latency	Value
Server latency	307 ms

https://valvantadigital.co.za/services/social-media-management

What the data shows
What the data shows
- Mobile: FCP 1202.37 ms, LCP 1202.37 ms, Speed Index 2537.72, TBT 887.5 ms.
- Desktop: FCP 548.44 ms, LCP 1348.44 ms, Speed Index 1217.07, TBT 0.5 ms.
- Requests are low: 17 total (15 returning 200; 2 non-200).
- Total transfer is ~2,002,687 bytes (mobile) / ~2,000,888 bytes (desktop); images ~1,369,219 bytes (mobile) / ~1,368,727 bytes (desktop).
- Mobile main-thread work is high (2552.99 ms) with heavy "Other" (1437.80 ms) and Script Evaluation (573.09 ms).

Key strengths
Key strengths
- Excellent desktop interactivity (TBT 0.5 ms) and solid desktop paint timings (FCP ~0.55 s).
- Request count is controlled (17), so the primary issue is not request volume.

Primary weaknesses
Primary weaknesses
- Very high mobile TBT (887.5 ms), the worst in the dataset, indicates significant mobile responsiveness problems.
- High mobile main-thread work (2552.99 ms), especially "Other" (1437.80 ms) and Script Evaluation (573.09 ms).
- Image payload is large (~1.37 MB) and includes a top transferred ~553 KB JPEG.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Treat as the top mobile performance priority (reduce TBT):
- Identify what is driving the large "Other" bucket (1437.80 ms) and reduce/defers that work to cut TBT from 887.5 ms.
- Reduce JavaScript evaluation cost (Script Evaluation 573.09 ms) by splitting/deferring non-critical code and trimming bundle weight where possible.
- Reduce image transfer and decode pressure:
- Optimise the large ~553 KB JPEG and other images contributing to ~1.37 MB image transfer.
- Fix non-200 requests:
- Resolve the two non-200 responses to remove unnecessary network and processing overhead.

What the data shows
What the data shows
- Mobile: FCP 1203.09 ms, LCP 1278.09 ms, Speed Index 2734.39, TBT 199.0 ms.
- Desktop: FCP 576.81 ms, LCP 576.81 ms, Speed Index 1319.46, TBT 10.0 ms.
- Very high request count: 82 requests (80 returning 200; 2 non-200).
- Third-party transfer is very large: ~1,248,892 bytes (mobile) / ~1,245,653 bytes (desktop) out of ~2.12 MB total transfer.
- A large script is a top transfer item: index-Dn6mhLJz.js transfer ~309,375 bytes with resource size ~1,030,665 bytes.

Key strengths
Key strengths
- Good interactivity for mobile relative to other URLs (TBT 199.0 ms) and strong desktop responsiveness (TBT 10.0 ms).
- Paint timings are stable and fast (mobile FCP ~1.20 s, desktop FCP ~0.58 s).

Primary weaknesses
Primary weaknesses
- High request count (82) increases overhead and opportunities for latency variance.
- Heavy third-party transfer (~1.25 MB) is a major contributor to total bytes and can create performance variability.
- Mobile main-thread work includes substantial Script Evaluation (452.17 ms), aligning with the large JS payload observed in transfers.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce third-party byte cost and dependency:
- Defer or reduce third-party resources contributing to the ~1.25 MB third-party transfer on this page.
- Reduce JS cost driving script evaluation:
- Review the large JS bundle (index-Dn6mhLJz.js) and reduce delivered code where possible to cut parse/eval overhead on mobile.
- Reduce request overhead:
- Consolidate or eliminate non-essential requests to bring 82 requests down, prioritising the heaviest/least critical resources first.
- Resolve non-200 requests:
- Identify and fix the two non-200 responses to remove wasted network and processing.

Basic metrics	Value
FCP	0.58 s
LCP	0.58 s
Speed Index	1.32 s
TBT	10 ms

Main thread work breakdown	Value
Total (numericValue)	371 ms
scriptEvaluation	132 ms
other	127 ms
styleLayout	65 ms

Diagnostic metrics	Value

Requests	82
Tasks	1652
Total byte weight	2.0 MB

Network metrics	Value
200 responses	80
Non-200 responses	2

Resource summary	Transfer size
Total	2.0 MB
Images	619.7 KB
Scripts	1.2 MB
Stylesheets	155.0 KB
Documents	69.2 KB
Third-party	1.2 MB

Network server latency	Value
Server latency	469 ms

What the data shows
What the data shows
- Mobile: FCP 1203.35 ms, LCP 1203.35 ms, Speed Index 2290.64, TBT 197.5 ms.
- Desktop: FCP 541.23 ms, LCP 717.23 ms, Speed Index 1085.71, TBT 0.0 ms.
- Low request count: 18 requests (16 returning 200; 2 non-200).
- Total transfer is moderate: ~1,531,487 bytes (mobile) / ~1,532,044 bytes (desktop); images are the largest share (~898 KB).
- The JS bundle (index-Dn6mhLJz.js) is again a top transfer resource (~309 KB transfer; ~1,030,665 bytes resource size).

Key strengths
Key strengths
- Strong desktop responsiveness (TBT 0.0 ms) and good desktop paint timings (FCP ~0.54 s).
- Efficient request count (18) relative to other pages, supporting predictable loading behavior.
- Mobile TBT (197.5 ms) is comparatively controlled.

Primary weaknesses
Primary weaknesses
- Mobile still shows meaningful main-thread script evaluation time (493.31 ms), consistent with the large JS bundle being a top transfer item.
- Images are a significant portion of transfer (~898 KB), leaving optimisation headroom.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce JavaScript evaluation pressure on mobile:
- Trim or defer non-critical code in the recurring JS bundle to reduce Script Evaluation (493.31 ms) and lower TBT further.
- Optimise image payload:
- Reduce image transfer (~898 KB) by compressing/resizing key images, prioritising those above the fold.
- Fix non-200 responses:
- Locate the two non-200 requests and correct them (remove broken URLs/redirect chains) to improve load cleanliness.

Basic metrics	Value
FCP	0.54 s
LCP	0.72 s
Speed Index	1.09 s
TBT	0 ms

Main thread work breakdown	Value
Total (numericValue)	444 ms
other	203 ms
scriptEvaluation	124 ms
styleLayout	86 ms

Diagnostic metrics	Value
Requests	18
Tasks	2069
Total byte weight	1.5 MB

Network metrics	Value
200 responses	16
Non-200 responses	2

Resource summary	Transfer size
Total	1.5 MB
Images	877.4 KB
Scripts	584.5 KB
Stylesheets	15.1 KB
Documents	9.8 KB
Third-party	286.8 KB

What the data shows
What the data shows
- Mobile: FCP 1206.84 ms, LCP 1281.84 ms, Speed Index 2642.26, TBT 373.0 ms.
- Desktop: FCP 551.53 ms, LCP 1641.53 ms, Speed Index 1114.49, TBT 3.0 ms.
- Requests are low: 17 total (15 returning 200; 2 non-200).
- Total transfer is moderate: ~1,548,297 bytes (mobile) / ~1,549,261 bytes (desktop); images ~916 KB and scripts ~598 KB.
- Main-thread on mobile is notable (1877.79 ms) with material Script Evaluation (480.61 ms).

Key strengths
Key strengths
- Low request count (17) supports manageable network overhead.
- Desktop interactivity is strong (TBT 3.0 ms).

Primary weaknesses
Primary weaknesses
- Mobile TBT is elevated (373.0 ms), indicating responsiveness risk compared with other service pages.
- Desktop LCP is relatively high (1641.53 ms) compared with the rest of the site, suggesting the largest element on desktop takes longer to complete.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Reduce mobile blocking time:
- Focus on reducing Script Evaluation (480.61 ms) and overall mobile main-thread work (1877.79 ms) to bring TBT down from 373.0 ms.
- Reduce weight of top resources:
- Optimise the main JS bundle (~309 KB transfer) and key images (including the service image ~289 KB transfer) to reduce load and processing cost.
- Resolve non-200 responses:
- Investigate and fix the two non-200 requests to eliminate wasted network and potential retries.

Basic metrics	Value
FCP	0.55 s
LCP	1.64 s
Speed Index	1.11 s
TBT	3 ms

Main thread work breakdown	Value
Total (numericValue)	510 ms
other	210 ms
scriptEvaluation	159 ms
styleLayout	107 ms

What the data shows
What the data shows
- Mobile: FCP 1202.37 ms, LCP 1202.37 ms, Speed Index 2537.72, TBT 887.5 ms.
- Desktop: FCP 548.44 ms, LCP 1348.44 ms, Speed Index 1217.07, TBT 0.5 ms.
- Requests are low: 17 total (15 returning 200; 2 non-200).
- Total transfer is ~2,002,687 bytes (mobile) / ~2,000,888 bytes (desktop); images ~1,369,219 bytes (mobile) / ~1,368,727 bytes (desktop).
- Mobile main-thread work is high (2552.99 ms) with heavy "Other" (1437.80 ms) and Script Evaluation (573.09 ms).

Key strengths
Key strengths
- Excellent desktop interactivity (TBT 0.5 ms) and solid desktop paint timings (FCP ~0.55 s).
- Request count is controlled (17), so the primary issue is not request volume.

Primary weaknesses
Primary weaknesses
- Very high mobile TBT (887.5 ms), the worst in the dataset, indicates significant mobile responsiveness problems.
- High mobile main-thread work (2552.99 ms), especially "Other" (1437.80 ms) and Script Evaluation (573.09 ms).
- Image payload is large (~1.37 MB) and includes a top transferred ~553 KB JPEG.
- Two non-200 responses are present (code_non_200_requests_count = 2).

Recommendations
Recommendations
- Treat as the top mobile performance priority (reduce TBT):
- Identify what is driving the large "Other" bucket (1437.80 ms) and reduce/defers that work to cut TBT from 887.5 ms.
- Reduce JavaScript evaluation cost (Script Evaluation 573.09 ms) by splitting/deferring non-critical code and trimming bundle weight where possible.
- Reduce image transfer and decode pressure:
- Optimise the large ~553 KB JPEG and other images contributing to ~1.37 MB image transfer.
- Fix non-200 requests:
- Resolve the two non-200 responses to remove unnecessary network and processing overhead.

Basic metrics	Value
FCP	0.55 s
