Full Website Audit Report

Technical & Performance Report

Client: Valvanta

Website: valvantadigital.co.za

Prepared by: Valvanta Digital Agency

Methodology

This audit uses Lighthouse in navigation mode with mobile emulation.

Lighthouse version	13.0.1
Audit date	2026-03-07T09:45:29.238967+00:00
Categories tested	performance, seo
Mode	navigation
Device emulation	mobile, desktop
URLs tested	5

Execution config

Config key	Value
only_categories	performance, seo
mobile	mobile emulation + throttling
desktop	desktop preset

Standards Alignment Statement

This report aligns findings to WCAG 2.1 Level A and AA (automated checks only), Google Core Web Vitals, and Google Search Essentials.

This audit reflects automated testing only and does not constitute full legal compliance certification.

Limitations & Scope Disclaimer

This report is based on automated Lighthouse checks and reflects a point-in-time snapshot. It does not replace manual testing, user research, or full compliance reviews.

Findings should be validated in real user conditions and with assistive technologies where applicable.

Tested URLs

All URLs included in this audit run.

#	URL
1	https://valvantadigital.co.za/
2	https://valvantadigital.co.za/about
3	https://valvantadigital.co.za/services/website-design
4	https://valvantadigital.co.za/services/ecommerce
5	https://valvantadigital.co.za/services/social-media-management

Executive Summary

What the data shows
- Overall rendering milestones are strong on both devices: average FCP is ~1225 ms (mobile) and ~569 ms (desktop); average LCP is ~1262 ms (mobile) and ~1087 ms (desktop).
- The main constraint is interactivity on mobile: average Total Blocking Time (TBT) is ~294 ms (desktop ~5 ms). One URL reaches 599 ms TBT on mobile, indicating meaningful main-thread contention for some pages.
- Page weight and request patterns are acceptable in count but heavy in bytes: average transfer is ~2.19 MB on both mobile and desktop, with images dominating (~1.39 MB) and scripts substantial (~0.73 MB). Third-party transfer is also material (~0.48 MB).
- Server latency is moderate (~324-345 ms average), and the slowest origins commonly include instagram.com and the site origin (valvantadigital.co.za), with tag/analytics endpoints also contributing.

Key strengths
- Strong paint and LCP timings at site level on both mobile and desktop (FCP ~0.6-1.2 s; LCP ~1.1-1.3 s).
- Desktop is consistently responsive: TBT averages ~5 ms, and main-thread work is relatively low (~476 ms).
- Request success rates are good: ~30 of ~33 requests return HTTP 200 on average; non-200 requests average ~2 (worth investigating, but not broadly breaking the experience).
- Stylesheet and document transfer sizes are comparatively small (styles ~44 KB avg; documents ~23 KB avg), suggesting the core overhead is not HTML/CSS bloat.

Primary weaknesses
- Mobile main-thread pressure: average main-thread work ~1853 ms and TBT ~294 ms, driven largely by "Other" and "Script Evaluation" groups. This increases input delay risk on mid/low-end phones.
- Image weight is the dominant contributor to total bytes (average image transfer ~1.39 MB; several pages exceed this significantly). This inflates Speed Index (mobile average ~2804) and makes performance more sensitive to network conditions.
- Third-party transfer and latency are non-trivial (average third-party transfer ~484 KB; slow origins include instagram.com and tag/analytics endpoints), which can add variability and delay on first loads.
- Some URLs have unusually high request counts (e.g., 82 requests) despite moderate page weight, suggesting many small dependencies and potential for overhead.

High level roadmap
- Phase 1 (high impact, low-medium effort): Reduce mobile blocking time by trimming and deferring JavaScript execution.
- Phase 2 (high impact, medium effort): Reduce image transfer by compressing and optimizing the largest image assets (especially PNG testimonial icons and large JPEGs).
- Phase 3 (medium impact, medium effort): Audit third-party usage and loading strategy to reduce transfer size and isolate or defer slower origins (notably instagram.com and tag/analytics).
- Phase 4 (medium impact, ongoing): Normalize request counts across templates by consolidating assets and ensuring consistent caching and dependency hygiene.

Summary metric	Mobile	Desktop
Overall score	0.93	0.94
Critical findings	0	0
High findings	0	0
Moderate findings	0	0
Advisory findings	0	0
Risk summary	Low risk: only advisory items identified.	Low risk: only advisory items identified.

Performance (Mobile) Findings

Findings are aligned to recognized standards and classified by severity.

No findings of high enough severity to report.

Performance (Desktop) Findings

Findings are aligned to recognized standards and classified by severity.

No findings of high enough severity to report.

Site Averages - Detailed Breakdown (Mobile)

Good targets: FCP <= 1.8s, LCP <= 2.5s, Speed Index <= 3.4s, TBT <= 200ms, Server latency <= 200ms.

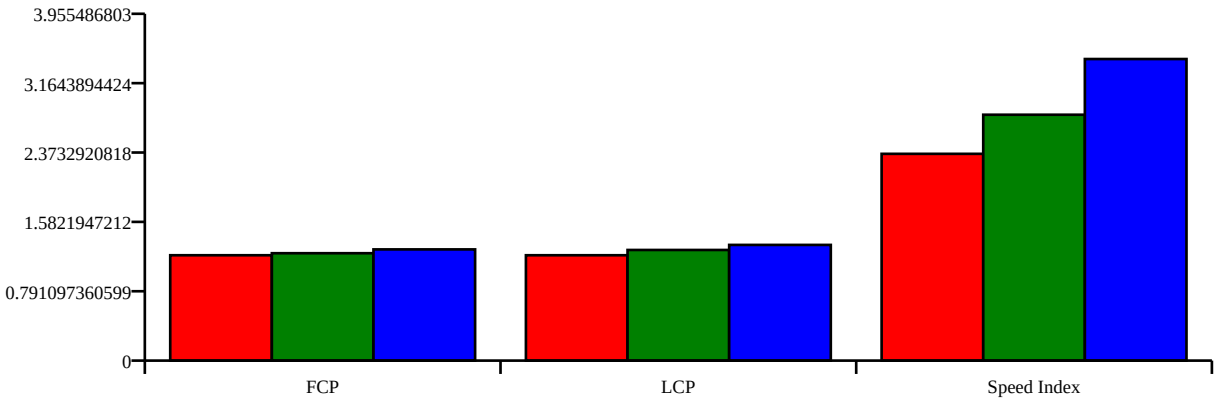

Benchmarks: **Top 10% (p10)** is the best-performing 10% of tested pages for each metric.

Metric definitions

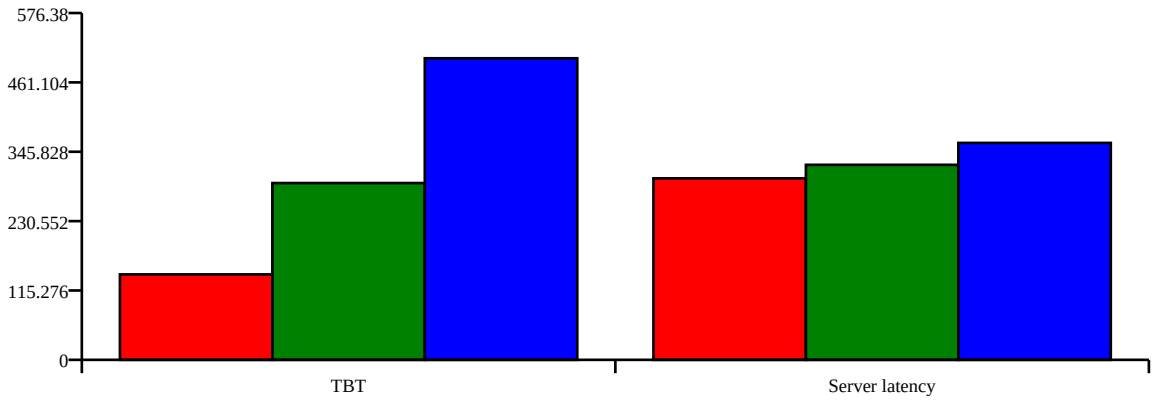

Metric	Meaning	Good target
FCP	First time content appears on screen.	≤ 1.8 s
LCP	Largest content element render time.	≤ 1.5 s
Speed Index	How quickly the page looks complete.	≤ 3.4 s
TBT	Total main-thread blocking time.	≤ 200 ms
Server latency	Backend responsiveness during load.	≤ 200 ms

Breakdown charts

Timing metrics (seconds)

Blocking and latency (milliseconds)

Basic metrics

Metric	Top 10% (p10)	Average	Worst 10% (p90)

FCP	1.20 s	1.22 s	1.27 s

Per URL Breakdown (Mobile)

Each URL is reported using the same breakdown sections as Site Averages.

Targets: FCP <= 1.8s, LCP <= 1.5s, Speed Index <= 3.4s, TBT <= 200ms, Server latency <= 200ms.

https://valvantadigital.co.za/

What the data shows
- Mobile: FCP 1310 ms, LCP 1346 ms, Speed Index 3919, TBT 354.5 ms, main-thread work 2956 ms, 29 requests, 3,767,270 bytes total transfer, server latency 331 ms.
- Desktop: FCP 594 ms, LCP 924 ms, Speed Index 2048, TBT 21 ms, main-thread work 827 ms, 28 requests, 3,765,984 bytes total transfer, server latency 344 ms.
- Transfer is dominated by images on both devices (3,128,940 bytes image transfer on mobile; 3,128,530 on desktop).

Key strengths
- Strong paint timings given the very large page weight (mobile LCP ~1.35 s; desktop LCP ~0.92 s).
- Desktop interactivity is good (TBT 21 ms) with moderate main-thread work (827 ms).
- Request counts are relatively contained (28-29 total) compared to other templates.

Primary weaknesses
- Very heavy total transfer (~3.77 MB) with images contributing ~3.13 MB, indicating the page is extremely image-weighted.
- Mobile main-thread and interactivity pressure is high (main-thread work ~2956 ms; TBT 354.5 ms).
- Largest transfers are individual images (e.g., ~810 KB and ~647 KB PNGs, plus a ~553 KB JPEG), increasing sensitivity to mobile bandwidth and delaying visual completion (Speed Index 3919).

Recommendations
- Reduce image transfer size materially: target the top-by-transfer PNGs/JPEGs (e.g., ~810 KB and ~647 KB testimonial icons; ~553 KB project image) by resizing to displayed dimensions and applying stronger compression.
- Re-balance image formats where feasible (e.g., prefer more efficient delivery formats) and ensure only necessary images load early to improve Speed Index (currently 3919 on mobile).
- Reduce mobile main-thread work by minimizing and deferring JavaScript execution; mobile TBT is 354.5 ms with substantial Script Evaluation (566 ms) and large 'Other' time (1388 ms).

Basic metrics	Value
FCP	1.31 s
LCP	1.35 s
Speed Index	3.92 s
TBT	354 ms

Main thread work breakdown	Value
Total (numericValue)	2956 ms
other	1388 ms

Stylesheets	15.1 KB
Documents	13.7 KB
Third-party	287.3 KB

Network server latency	Value
Server latency	331 ms

https://valvantadigital.co.za/about

What the data shows
- Mobile: FCP 1204 ms, LCP 1279 ms, Speed Index 2720, TBT 221 ms, main-thread work 1396 ms, 82 requests, 2,114,812 bytes total transfer, server latency 380 ms.
- Desktop: FCP 624 ms, LCP 624 ms, Speed Index 1108, TBT 0 ms, main-thread work 344 ms, 82 requests, 2,122,516 bytes total transfer, server latency 476 ms.
- Scripts and third-party transfer are large on this page: mobile script transfer 1,239,685 bytes and third-party transfer 1,245,995 bytes (similar on desktop).

Key strengths
- Strong desktop responsiveness (TBT 0 ms) and low desktop main-thread work (344 ms).
- Good LCP on both devices (mobile 1279 ms; desktop 624 ms).
- Total transfer is moderate (~2.12 MB) compared to the homepage.

Primary weaknesses
- Very high request count (82) on both mobile and desktop, which adds overhead and can increase the impact of latency.
- Exceptionally high third-party transfer (~1.25 MB) relative to total transfer (~2.11 MB), suggesting a large portion of the page weight comes from external dependencies.
- Large script transfer (~1.24 MB) and mobile main-thread pressure (TBT 221 ms; Script Evaluation 482 ms) indicate JavaScript is a key driver of mobile interactivity cost.
- Higher server latency than other pages (mobile 380 ms; desktop 476 ms).

Recommendations
- Reduce request count from 82 by consolidating assets and removing redundant dependencies; prioritize anything not required for initial render.
- Reduce third-party transfer by auditing third-party inclusions and deferring non-critical external resources; the page shows ~1.25 MB third-party transfer.
- Reduce JavaScript cost (mobile TBT 221 ms; script transfer ~1.24 MB) by splitting bundles and deferring non-essential scripts; the top script has ~309 KB transfer and ~1,030,665 resource size, indicating scope for code-splitting and payload reduction.

Basic metrics	Value
FCP	1.20 s
LCP	1.28 s
Speed Index	2.72 s
TBT	221 ms

Main thread work breakdown	Value
Total (numericValue)	1396 ms
other	488 ms
scriptEvaluation	482 ms
styleLayout	266 ms

Diagnostic metrics	Value
Requests	82
Tasks	1597
Total byte weight	2.0 MB

Network metrics	Value
200 responses	80

Non-200 responses	2

Resource summary	Transfer size
Total	2.0 MB
Images	620.2 KB
Scripts	1.2 MB
Stylesheets	155.0 KB
Documents	69.5 KB
Third-party	1.2 MB

Network server latency	Value
Server latency	380 ms

https://valvantadigital.co.za/services/website-design

What the data shows
- Mobile: FCP 1204 ms, LCP 1204 ms, Speed Index 2279, TBT 121 ms, main-thread work 1385 ms, 18 requests, 1,531,267 bytes total transfer, server latency 304 ms.
- Desktop: FCP 541 ms, LCP 661 ms, Speed Index 1023, TBT 0 ms, main-thread work 343 ms, 18 requests, 1,531,947 bytes total transfer, server latency 301 ms.
- Transfer composition is balanced: images ~898 KB and scripts ~598 KB on mobile (similar on desktop).

Key strengths
- Low request count (18) and moderate total transfer (~1.53 MB) support efficient loading.
- Excellent desktop interactivity (TBT 0 ms) with low main-thread work (~343 ms).
- Strong LCP on both devices (mobile 1204 ms; desktop 661 ms) and good Speed Index on desktop (1023).

Primary weaknesses
- Mobile still shows measurable main-thread blocking (TBT 121 ms) and substantial Script Evaluation time (412 ms).
- Images remain the largest byte contributor (~898 KB), meaning additional image optimization could further reduce mobile load time and Speed Index (2279).

Recommendations
- Reduce mobile TBT by trimming/defering JavaScript work; Script Evaluation is 412 ms and main-thread work is ~1385 ms.
- Optimize the largest images (mobile image transfer ~898 KB) via resizing and compression to reduce total transfer and improve Speed Index (currently 2279).
- Maintain the low request count pattern (18) when extending the template to avoid the overhead seen on higher-request pages.

Basic metrics	Value
FCP	1.20 s
LCP	1.20 s
Speed Index	2.28 s
TBT	121 ms

Main thread work breakdown	Value
Total (numericValue)	1385 ms
other	603 ms
scriptEvaluation	412 ms
styleLayout	249 ms

Diagnostic metrics	Value
Requests	18
Tasks	2440
Total byte weight	1.5 MB

Network metrics	Value
200 responses	16
Non-200 responses	2

Resource summary	Transfer size
Total	1.5 MB

Images	876.9 KB
Scripts	584.3 KB
Stylesheets	15.1 KB
Documents	9.8 KB
Third-party	286.2 KB

Network server latency	Value
Server latency	304 ms

https://valvantadigital.co.za/services/ecommerce

What the data shows
- Mobile: FCP 1200 ms, LCP 1200 ms, Speed Index 2626, TBT 599 ms, main-thread work 1913 ms, 17 requests, 1,548,370 bytes total transfer, server latency 300 ms.
- Desktop: FCP 539 ms, LCP 1639 ms, Speed Index 1201, TBT 4 ms, main-thread work 425 ms, 17 requests, 1,549,015 bytes total transfer, server latency 299 ms.
- Transfer is moderate (~1.55 MB) with images ~916 KB and scripts ~598 KB.

Key strengths
- Efficient request count (17) and moderate total transfer (~1.55 MB).
- Strong paint timings on mobile for LCP (1200 ms).
- Desktop main-thread and TBT are low (main-thread ~425 ms; TBT 4 ms).

Primary weaknesses
- Very high mobile TBT (599 ms), the worst in the dataset, indicating significant main-thread blocking and poorer responsiveness on mobile.
- High mobile main-thread work (~1913 ms) with large 'Other' time (~1063 ms) and substantial Script Evaluation (~492 ms).
- Desktop LCP is notably higher here (1639 ms) versus other service pages, despite similar transfer size, indicating something critical for LCP is delayed on desktop for this URL.

Recommendations
- Prioritize reducing mobile blocking: target the sources of Script Evaluation (491.7 ms) and large 'Other' work (1062.9 ms) to bring TBT down from 599 ms (e.g., reduce JS execution during initial load and delay non-critical work).
- Review critical resource loading sequence to improve desktop LCP (currently 1639 ms) by ensuring the LCP element is not delayed behind other work/resources.
- Continue optimizing images (~916 KB) to reduce total transfer and improve Speed Index (2626 on mobile).

Basic metrics	Value
FCP	1.20 s
LCP	1.20 s
Speed Index	2.63 s
TBT	599 ms

Main thread work breakdown	Value
Total (numericValue)	1913 ms
other	1063 ms
scriptEvaluation	492 ms
styleLayout	250 ms

200 responses	15
Non-200 responses	2

Resource summary	Transfer size

Total	1.5 MB
Images	894.2 KB
Scripts	584.1 KB
Stylesheets	15.1 KB
Documents	9.4 KB
Third-party	286.2 KB

Network server latency	**Value**
Server latency	300 ms

https://valvantadigital.co.za/services/social-media-management

What the data shows
- Mobile: FCP 1205 ms, LCP 1280 ms, Speed Index 2477, TBT 173.5 ms, main-thread work 1617 ms, 17 requests, 2,003,341 bytes total transfer, server latency 305 ms.
- Desktop: FCP 545 ms, LCP 1585 ms, Speed Index 4604, TBT 0 ms, main-thread work 443 ms, 17 requests, 2,002,199 bytes total transfer, server latency 305 ms.
- Images are the dominant byte driver: ~1,369,696 bytes image transfer on mobile (~1,369,356 on desktop).

Key strengths
- Low request count (17) and good mobile LCP (1280 ms).
- Desktop interactivity is excellent (TBT 0 ms) with modest main-thread work (~443 ms).
- Server latency is stable and moderate (~305 ms) across devices.

Primary weaknesses
- Heavy image transfer (~1.37 MB) is a primary contributor to total transfer (~2.00 MB). The largest image is ~553 KB and loads with low priority in the request list, which can delay visual completeness.
- Mobile TBT is non-trivial (173.5 ms) with substantial Script Evaluation (427 ms) and 'Other' work (802 ms).
- Desktop Speed Index is very high (4604) despite moderate bytes and request count, indicating delayed visual completion on desktop for this URL.

Recommendations
- Reduce image bytes (currently ~1.37 MB) by compressing/resizing the largest images (including the ~553 KB JPEG) to improve Speed Index on both devices (desktop is 4604).
- Improve mobile responsiveness by reducing JS execution and main-thread work; focus on Script Evaluation (427 ms) and large 'Other' work (802 ms) to lower TBT (173.5 ms).
- Investigate the load ordering and prioritization of above-the-fold imagery since a top transfer image is marked Low priority; ensuring critical imagery is delivered efficiently can improve visual progression.

Basic metrics	Value
FCP	1.21 s
LCP	1.28 s

Server latency	344 ms

https://valvantadigital.co.za/about

What the data shows
- Mobile: FCP 1204 ms, LCP 1279 ms, Speed Index 2720, TBT 221 ms, main-thread work 1396 ms, 82 requests, 2,114,812 bytes total transfer, server latency 380 ms.
- Desktop: FCP 624 ms, LCP 624 ms, Speed Index 1108, TBT 0 ms, main-thread work 344 ms, 82 requests, 2,122,516 bytes total transfer, server latency 476 ms.
- Scripts and third-party transfer are large on this page: mobile script transfer 1,239,685 bytes and third-party transfer 1,245,995 bytes (similar on desktop).

Key strengths
- Strong desktop responsiveness (TBT 0 ms) and low desktop main-thread work (344 ms).
- Good LCP on both devices (mobile 1279 ms; desktop 624 ms).
- Total transfer is moderate (~2.12 MB) compared to the homepage.

Primary weaknesses
- Very high request count (82) on both mobile and desktop, which adds overhead and can increase the impact of latency.
- Exceptionally high third-party transfer (~1.25 MB) relative to total transfer (~2.11 MB), suggesting a large portion of the page weight comes from external dependencies.
- Large script transfer (~1.24 MB) and mobile main-thread pressure (TBT 221 ms; Script Evaluation 482 ms) indicate JavaScript is a key driver of mobile interactivity cost.
- Higher server latency than other pages (mobile 380 ms; desktop 476 ms).

Recommendations
- Reduce request count from 82 by consolidating assets and removing redundant dependencies; prioritize anything not required for initial render.
- Reduce third-party transfer by auditing third-party inclusions and deferring non-critical external resources; the page shows ~1.25 MB third-party transfer.
- Reduce JavaScript cost (mobile TBT 221 ms; script transfer ~1.24 MB) by splitting bundles and deferring non-essential scripts; the top script has ~309 KB transfer and ~1,030,665 resource size, indicating scope for code-splitting and payload reduction.

Server latency	476 ms

https://valvantadigital.co.za/services/website-design

What the data shows
- Mobile: FCP 1204 ms, LCP 1204 ms, Speed Index 2279, TBT 121 ms, main-thread work 1385 ms, 18 requests, 1,531,267 bytes total transfer, server latency 304 ms.
- Desktop: FCP 541 ms, LCP 661 ms, Speed Index 1023, TBT 0 ms, main-thread work 343 ms, 18 requests, 1,531,947 bytes total transfer, server latency 301 ms.
- Transfer composition is balanced: images ~898 KB and scripts ~598 KB on mobile (similar on desktop).

Key strengths
- Low request count (18) and moderate total transfer (~1.53 MB) support efficient loading.
- Excellent desktop interactivity (TBT 0 ms) with low main-thread work (~343 ms).
- Strong LCP on both devices (mobile 1204 ms; desktop 661 ms) and good Speed Index on desktop (1023).

Primary weaknesses
- Mobile still shows measurable main-thread blocking (TBT 121 ms) and substantial Script Evaluation time (412 ms).
- Images remain the largest byte contributor (~898 KB), meaning additional image optimization could further reduce mobile load time and Speed Index (2279).

Recommendations
- Reduce mobile TBT by trimming/defering JavaScript work; Script Evaluation is 412 ms and main-thread work is ~1385 ms.
- Optimize the largest images (mobile image transfer ~898 KB) via resizing and compression to reduce total transfer and improve Speed Index (currently 2279).
- Maintain the low request count pattern (18) when extending the template to avoid the overhead seen on higher-request pages.

Basic metrics	Value
FCP	0.54 s
LCP	0.66 s
Speed Index	1.02 s
TBT	0 ms

Main thread work breakdown	Value
Total (numericValue)	343 ms
other	144 ms
scriptEvaluation	100 ms
styleLayout	71 ms

Diagnostic metrics	Value
Requests	18
Tasks	2190
Total byte weight	1.5 MB

Network metrics	Value
200 responses	16
Non-200 responses	2

Resource summary	Transfer size
Total	1.5 MB

Images	877.5 KB
Scripts	584.3 KB
Stylesheets	15.1 KB
Documents	9.8 KB
Third-party	286.2 KB

Network server latency	Value
Server latency	301 ms

What the data shows
- Mobile: FCP 1200 ms, LCP 1200 ms, Speed Index 2626, TBT 599 ms, main-thread work 1913 ms, 17 requests, 1,548,370 bytes total transfer, server latency 300 ms.
- Desktop: FCP 539 ms, LCP 1639 ms, Speed Index 1201, TBT 4 ms, main-thread work 425 ms, 17 requests, 1,549,015 bytes total transfer, server latency 299 ms.
- Transfer is moderate (~1.55 MB) with images ~916 KB and scripts ~598 KB.

Key strengths
- Efficient request count (17) and moderate total transfer (~1.55 MB).
- Strong paint timings on mobile for LCP (1200 ms).
- Desktop main-thread and TBT are low (main-thread ~425 ms; TBT 4 ms).

Primary weaknesses
- Very high mobile TBT (599 ms), the worst in the dataset, indicating significant main-thread blocking and poorer responsiveness on mobile.
- High mobile main-thread work (~1913 ms) with large 'Other' time (~1063 ms) and substantial Script Evaluation (~492 ms).
- Desktop LCP is notably higher here (1639 ms) versus other service pages, despite similar transfer size, indicating something critical for LCP is delayed on desktop for this URL.

Recommendations
- Prioritize reducing mobile blocking: target the sources of Script Evaluation (491.7 ms) and large 'Other' work (1062.9 ms) to bring TBT down from 599 ms (e.g., reduce JS execution during initial load and delay non-critical work).
- Review critical resource loading sequence to improve desktop LCP (currently 1639 ms) by ensuring the LCP element is not delayed behind other work/resources.
- Continue optimizing images (~916 KB) to reduce total transfer and improve Speed Index (2626 on mobile).

Basic metrics	Value
FCP	0.54 s
LCP	1.64 s
Speed Index	1.20 s
TBT	4 ms

Main thread work breakdown	Value
Total (numericValue)	425 ms
other	151 ms
scriptEvaluation	150 ms
styleLayout	81 ms

Diagnostic metrics	Value
Requests	17
Tasks	2330
Total byte weight	1.5 MB

What the data shows
- Mobile: FCP 1205 ms, LCP 1280 ms, Speed Index 2477, TBT 173.5 ms, main-thread work 1617 ms, 17 requests, 2,003,341 bytes total transfer, server latency 305 ms.
- Desktop: FCP 545 ms, LCP 1585 ms, Speed Index 4604, TBT 0 ms, main-thread work 443 ms, 17 requests, 2,002,199 bytes total transfer, server latency 305 ms.
- Images are the dominant byte driver: ~1,369,696 bytes image transfer on mobile (~1,369,356 on desktop).

Key strengths
- Low request count (17) and good mobile LCP (1280 ms).
- Desktop interactivity is excellent (TBT 0 ms) with modest main-thread work (~443 ms).
- Server latency is stable and moderate (~305 ms) across devices.

Primary weaknesses
- Heavy image transfer (~1.37 MB) is a primary contributor to total transfer (~2.00 MB). The largest image is ~553 KB and loads with low priority in the request list, which can delay visual completeness.
- Mobile TBT is non-trivial (173.5 ms) with substantial Script Evaluation (427 ms) and 'Other' work (802 ms).
- Desktop Speed Index is very high (4604) despite moderate bytes and request count, indicating delayed visual completion on desktop for this URL.

Recommendations
- Reduce image bytes (currently ~1.37 MB) by compressing/resizing the largest images (including the ~553 KB JPEG) to improve Speed Index on both devices (desktop is 4604).
- Improve mobile responsiveness by reducing JS execution and main-thread work; focus on Script Evaluation (427 ms) and large 'Other' work (802 ms) to lower TBT (173.5 ms).
- Investigate the load ordering and prioritization of above-the-fold imagery since a top transfer image is marked Low priority; ensuring critical imagery is delivered efficiently can improve visual progression.

Basic metrics	Value
FCP	0.54 s
LCP	1.58 s
Speed Index	4.60 s
TBT	0 ms
