Full Website Audit Report

Key Findings & Priorities

Client: nicola

Website: nicolaphiriphotography.com

Prepared by: Valvanta Digital Agency

Methodology

This audit uses Lighthouse in navigation mode with mobile emulation.

Lighthouse version	13.0.1
Audit date	2026-03-07T09:29:51.231793+00:00
Categories tested	p, e, r, f, o, r, m, a, n, c, e, ,, , s, e, o
Mode	navigation
Device emulation	mobile, desktop
URLs tested	5

Execution config

Config key	Value
only_categories	performance, seo
mobile	mobile emulation + throttling
desktop	desktop preset

Standards Alignment Statement

This report aligns findings to WCAG 2.1 Level A and AA (automated checks only), Google Core Web Vitals, and Google Search Essentials.

This audit reflects automated testing only and does not constitute full legal compliance certification.

Limitations & Scope Disclaimer

This report is based on automated Lighthouse checks and reflects a point-in-time snapshot. It does not replace manual testing, user research, or full compliance reviews.

Findings should be validated in real user conditions and with assistive technologies where applicable.

Tested URLs

All URLs included in this audit run.

Key Findings & Priorities

Prioritisation method: Prioritised by (1) breadth of impact across URLs and devices, (2) magnitude of user-visible impact indicated by the metrics (LCP, Speed Index, TBT, transfer size, request/task counts), and (3) implementation effort inferred from whether the issue is primarily content/config (low effort) versus systemic/template/runtime behavior (medium/high effort).

Issue	Priority	Impact	Effort	Short explanation
Homepage page weight and image transfer are extreme, driving poor LCP and high mobile blocking time	High	Improves core loading experience on the most important entry page; expected gains in mobile LCP, Speed Index, and responsiveness by reducing the primary bottleneck (image payload and associated work).	Medium	The homepage transfers ~18.4 MB total with ~17.6 MB images and 76 requests on both mobile and desktop, with mobile LCP 9710.0 ms and TBT 541.0 ms. This is far above site averages and is the single largest performance outlier.
Site-wide canonical failures on 4/5 URLs	High	Reduces duplicate-content ambiguity and consolidates ranking signals; likely improves indexation consistency and SEO resilience across the site.	Low	The SEO dataset shows canonical failing on 80% of sampled URLs on both mobile and desktop (4 failures out of 5 URLs). Other SEO audits largely pass, making canonical the clear highest-leverage fix.
Mobile LCP is consistently high across the site set	High	Faster perceived load and improved user engagement on mobile; addresses a key user-facing metric across all tested pages.	Medium	Mobile average LCP is 7407.2 ms with similarly high mobile FCP (~4379.6 ms) and Speed Index (~7996.7 ms). Image transfer averages are high (~4.38 MB) and correlate strongly with LCP outcomes.
Mobile main-thread work and Total Blocking Time are elevated, especially on key pages	Medium	Improves interactivity and reduces input delay on mobile, particularly on the homepage and portfolio/services pages where blocking is highest.	Medium	Mobile average TBT is 315.3 ms (vs 65.4 ms desktop). Pages like the homepage (541 ms) and portfolio (451 ms) are notably higher and also show higher main-thread work.
Request count variability suggests inconsistent payload discipline across templates	Medium	Reduces network overhead and improves reliability on mobile connections; helps stabilize Speed Index and overall load consistency.	Low	Site averages are ~30 requests, but the homepage is 76 requests while other pages range from 14-23 requests. Reducing outliers will improve consistency and reduce critical-path congestion.
